Subject: Re: Cassia confirmation

Hi Peter,

Yeah, Tim and I talked about this after we both were sent the recordings from different people and came upon the ID independently. The spectrogram starts with an initial upward component but is overall downward modulated. The flight call is largely given in a lower frequency domain (below 4.0 kHz) than Types 1 and 2. It also has secondary ending components(it's a two-parted call). Overall, the Cassia Crossbill flight call sounds much lower and there's a flat harsh quality to them. To our ear the *dip-dip-dip* call actually has an agitated quality to it.

Hope this helps!

Matt

Hi Peter, sorry for the delay. I'll let Matt respond on his own. We both independently identified these as Cassia Crossbill on the sound of the flight calls and the shape of the spectrograms. The only real possibility for confusion would be Type 5, a relatively common type in Colorado, but Christian's birds were easily separable. If you'd like a little writeup with the spectrograms included, etc, just let me know.

Really sorry to have delayed this so long! I have served on the Committee here in MA and know the difficulty of your work.

Best,

Tim

Tim Spahr and Matt Young,

I am chairman of the Colorado Field Ornithologists records committee. Christian Nunes has submitted a first state record of Cassia Crossbill from Grand County in July, 2021. He says that you two have reviewed this record and the sound recordings. It would be very helpful to the committee if you would reply very briefly about your conclusions.

Thanks, Peter Gent.
