RESULTS:

Species:(Common Name) WHITE IBIS		(Scientific Name) <i>Eudocimus albus</i>	
Date(s) of occurrence: 25 April 2000			
Number of birds seen: One	Sex: Unknown	Plumage: Adult	
Exact location: Southwest corner of Barr Lake			
County: Adams	Nearest town: Brighton	Elevation: 5100 msl	
Length of observation: Approximately one hour off an on		Time(s) of observation: Late afternoon/early evening	
Other observers who saw the bird(s) with you: Tony Leukering, Doug Faulkner, Chris Wood			
Other Observers who independently saw the bird(s): Many			
Light Conditions (quality; direction relative to bird(s); position: Clear skies, facing east with sun to back.			
Optical equipment used: 8x40 Binoculars, 32X Spotting Scope			
Distance from bird(s) (estimated unless otherwise noted): Approximately 100 yards			
Was bird(s) photographed? Yes		If so, have you submitted photos? Yes	
Who took the photographs? Larry Semo			

Describe the general and specific habitat in which the bird(s) occurred: Flooded woodlands along edge of lake with large pockets of open water.

Describe the bird's behavior (flying, feeding, habits, behaviors used in identifying the Species or in supporting the identification): Foraging by walking along in shallow water. The bird did fly a couple of times when going to roost in trees.

Describe the bird in detail. This is the most important part of this report. Include the overall size and shape and how you placed the bird in the general group that you did. Give complete details of plumage, including head, throat, undersides, nape, back, wings and tail. Give particular emphasis to marks you used to identify the bird(s). Describe other important details, such as color and shape of bill, legs, eye, (etc.) that were important in making the identification. (Fill out this portion even if photographs are submitted; you may attach additional sheets, drawings, field sketches or copy field notes):

Hearing of a probable report of a White Ibis at Barr Lake, Tony Leukering, Doug Faulkner, and I arrived at the lake in late afternoon. After searching for approximately 45 minutes to no avail, I spotted the ibis on the far shore of an open-water bay of the lake. The bird was subsequently observed foraging in shallow water within flooded trees for perhaps another 45 minutes until it flew into a tree to roost for the evening. The following indicate observation points noted in the field.

Overall Size and Shape: Medium-sized white heron (approximately 2.5 feet in height) with long red decurved bill, and red legs.

Bill: Long, roughly 3 times the length of the head. Very decurved starting at roughly the basal third. Bill all bright red except for dark lower third (tip may have been red).

Head: Mostly white except for the proximal third being all red due to bright red facial skin than surrounded the eye.

Body: Hump-backed in appearance in its' head-down foraging behavior. The entire body was snow-white except for a black tips to the primaries which barely protruded from the remainder of the wings. In flight, however, the ends of the wings appeared to be "dipped in ink" because of these black-tipped primaries.

Legs: Moderate in length (for a heron) but extended well beyond tail when in flight. The legs appeared bright red throughout.

Describe bird's call or song: None heard

Discuss similar species and how you eliminated them: The combination of relatively tall height, necked, and legged indicate a heron. The long, decurved bill is indicative of an Ibis. No other ibis has a combination of mostly white plumage, bright red bill, face, and legs, and black primary tips contrasting to the white plumage.

What is your prior experience with this and similarly appearing species? Have observed countless others in Texas, Louisiana, Mississippi, Florida, and Mexico.

List books, guides, recordings or other sources consulted and how this influenced your identification (during and after observation): None
