

Sorry, I'm no where near a computer.

SCISSOR-TAILED FLYCATCHER - 7-1-00 @ 11:30 AM
LITTLE BURNT MILL Rd. So side of PEBLO

We had stopped for a look at horned larks and Cassin's sparrows on Little Burnt Mill Rd. As we were pulling out back onto road a rather large flycatcher flew right over the car + in front of the window. I got out for a good look at the pearly gray flycatcher with a "cool" looking tail! It did not have a Western Kingbird tail. Then she or young bird flew up again with grasshopper - spread its wings + tail out over my head then crossed the road and landed on the fence line not 10 feet away. By then I'm screaming SCISSOR-TAIL !!! I had seen the dark salmon axillaries and buffy wing ~~line~~ linings. The wing linings weren't as dark a salmon color ^{as} of an adult male. The longer outer-tail dark feathers and white central or inner feathers formed an "omega" shape of white surrounded by dark charcoal. Typical flycatcher bill. Darkish smudge

between the bill + eye. Head, mantle, breast
throat and belly pearly gray. "a
blush of pink or salmon on flanks."
No red on shoulder so it may
have been a female or young bird.
No red on throat so a Rose-throated
Becard is out. also the tail very
long + "forked"!

I hope this adequately describes
the bird we all saw. If
you need more experienced
info — Dave Silverman also
observed the bird.
